

Components & Styling

- Href links to links different pages
- Img src to insert images
- Div to separate different body parts.
- Hover buttons
- Simple font and styles.
- Responsive design to suit all devices.

Decision making process

- Design the web page on WireFrames Balsamic
- Build the website on VSCode without checking responsive function for mobile phone first. This is the biggest mistake.
- Try different ways to implement a text and a paragraph on CSS. This was not easy.
- Flexbox is the hardest part but once it works, it makes everything perfect.
- Created “Projects pages” to practise and learn more about Flexbox.

Favourite parts and Ethical issues

- All pages are my favourite parts as different components and stylings were used.
- Home page : learn how to build nav bar, insert background logo.
- About page: learn how to embed a PDF.
- Blog page: learn how to put photo gallery in a frame by using float.
- Projects page: reapply flex box + float.
- Ethical issues: Images from internet need to be a free download version.
